

<b>Course:</b>	Python Programming			<b>Semester:</b>	First
<b>Division:</b>	C5	<b>Batch:</b>	C5-3	<b>Date:</b>	27/11/2024
<b>Exam:</b>	ON SCREEN TEST	<b>SET:</b>	A	<b>Time:</b>	4 PM to 5:30 PM
<b>Name:</b>	RAJAT KUMAR			<b>Roll No:</b>	16014224054

**NOTE: COPY-PASTE code and output/error. Do not paste screen-shot/image**

Q No	Question	Marks
1	<p><b>PROGRAM 1 CODE: (Copy your program below)</b></p> <pre>l=input("Enter the elements of list (space-seperated): ").split() #converting each element of list to integer datatype l=list(map(int,l)) #then, filtering the given list on required condition using lambda function! new_l=list(filter(lambda x:x&lt;10 and x%2!=0 , l)) print(new_l , "," , len(new_l))</pre> <p><b>PROGRAM 1 OUTPUT/ ERROR: (Copy your output below)</b></p> 	08
2	<p><b>PROGRAM 2 CODE: (Copy your program below)</b></p> <pre>#importing the required python libraries import numpy as np import matplotlib.pyplot as plt  #generating data using NumPy library as required. l=np.arange(0,12.566,0.2) list=list(map(float,l))</pre>	12

```
y_sin=[float(np.sin(x)) for x in list]
y_cos=[float(np.cos(x)) for x in list]
y_tan=[float(np.tan(x)) for x in list]

plt.plot(y_sin, color = 'r',label='sin')
plt.plot(y_cos, color = 'g',label='cos')
plt.plot(y_tan, color = 'b',label='tan')

plt.xlabel("Trigonometry Functions (Sin/Cos/Tan)")
plt.ylabel("Respective Waveforms")

plt.title("TRIGNOMETRIC FUNCTIONS WAVEFORMS")
plt.grid()
plt.legend()
plt.show()
```

**PROGRAM 2 OUTPUT/ ERROR: (Copy your output below)**
